

PRATIK PATEL

Chief Architect | AI Agents & Agentic Platforms | Cloud | 3x Company Builder

Washington, DC (Open to Remote) | (518) 636-9399 | pratik@pa.tel
pa.tel | linkedin.com/in/prpatel05 | x.com/prpatel05 | github.com/prpatel05

SUMMARY

Chief Architect for OpenApps, Bounded, and poof.new. Building AI agent platforms and the policy-enforced agent runtime so coding agents can ship real apps with verify/deploy gates, data boundaries, auth, functions, realtime, payments, and hosting.

Three-time company builder: grew a 30-person engineering org at AWS, co-founded and sold a blockchain studio via acquisition by Dapper Labs, and took a healthtech startup from napkin sketch to 50K+ users as founding CTO.

Hands-on platform architect for agentic systems: set technical strategy, ship the hard parts of the stack, and speak for the architecture with founders and investors.

EXPERIENCE

Chief Architect

Aug 2025 - Present

OpenApps | Bounded | poof.new

openapps.xyz | bounded.sh | poof.new

Full-stack AI agent platforms. OpenApps hosts autonomously run, openly governed apps that outlive their makers; Bounded is the policy-enforced runtime those apps run on; poof.new is the earlier product line the same team carried forward.

- Own the full-stack architecture for Bounded: agent app builder plus policy-enforced runtime spanning verify/deploy gates, promoted data boundaries and invariants, auth (users, sessions, roles, OAuth, email OTP), data/files, server functions with secrets and hooks, realtime/live queries, live room state, payments, AI services, and hosting.
- Design the agent-runtime contract so coding agents (Claude Code, Codex, and peers) can build while Bounded enforces declared boundaries on every write: refused cross-boundary mutations, watched/approved routed actions, and deploy gates that keep apps safe to iterate (including lock mode so future edits cannot weaken declared invariants).
- Ship the verify/deploy loop agents rely on: policy.json collections, rules, and invariants; bounded verify with concrete counterexamples before deploy; fail-closed server-side proof gates; web and React Native clients via the Bounded SDK (@bounded-sh/client) on bounded.page or custom domains.
- Establish the agentic platform strategy and ship automated test and eval harnesses for Claude Code / Codex workflows and MCP integrations, accelerating feature velocity within the first 90 days.
- Design agent-facing delivery so coding agents can initialize, verify, deploy, and exercise a full app from one repo: CLI + agent skill install, declare -> verify -> deploy with fail-closed proof gates, and intentional boundary-rejection checks before anything ships.
- Design and ship multi-LLM routing that directs requests across model providers by task complexity, cutting AI infrastructure cost while holding output quality.
- Carry deployment and edge foundations into Bounded: multi-tenant isolation with cost-efficient unit economics, plus cold-start work that cut sandbox starts ~60% and supported 5K+ concurrent sessions.
- Advance OpenApps on that runtime: alliance-backed apps that stay autonomously run and openly governed after their makers step back, with shared hosting, auth, data, payments, and deploy path on Bounded; keep poof.new product lineage clear for the same team.
- Cover the managed operator surface in one identity: files/search, Functions and jobs with secrets, realtime subscriptions and server-authoritative live rooms, managed AI/services, direct USDC or provider card payments, action observability, and team governance with roles and approvals.
- Primary technical voice for architecture, roadmap, and infrastructure cost model across OpenApps, Bounded, and poof.new.

Chief Technology Officer

May 2023 - Aug 2025 (Advisor to Dec 2025)

eddi

Seed-stage healthtech building AI-powered diabetes management. Sole technical executive; team of 6.

- Sole C-level technology leader: defined product and tech strategy, architected the full HIPAA-compliant platform from scratch, and delivered to market on time and 20% under budget.

- Scaled the platform to 50K+ users in under 12 months, validating product-market fit and forging strategic partnerships with healthcare providers and insurers.
- Pioneered the AI/ML strategy for diabetes care: integrated LLMs into an AI-powered chatbot that delivered personalized health insights and drove a 35% increase in daily active usage within 6 months.
- Led investor-facing technical demos and narrative that directly contributed to closing \$3.5M across multiple venture rounds; managed the full technology P&L and all engineering hiring.

Co-Founder & CTO -> Senior Software Engineer II

Jun 2021 - May 2023

Dapper Labs (via Acq. of Zay Codes)

Co-founded blockchain studio; acquired by Dapper Labs; retained to lead technical integration. Team of 15. Overlapped AWS through Mar 2022.

- Co-founded the company, recruited and managed a 15-person engineering team, and secured 5 client contracts to design and ship production dApps on the Flow blockchain.
- Won \$100K+ in hackathon prizes building open-source developer tools, raising brand visibility across the Flow ecosystem and accelerating acquisition interest from Dapper Labs.
- Managed full P&L and led all acquisition negotiations and legal workstreams end-to-end, culminating in a successful acqui-hire by Dapper Labs.
- Built the NFT Catalog (adopted as a community-wide standard) and Flow Runner; delivered the API integration used by Instagram to display Flow-based NFTs.
- Led post-acquisition technical integration into Dapper Labs and mentored engineers as the Flow smart-contract SME.

Senior SDE -> Lead, Proactive Security

Jan 2015 - Mar 2022

Amazon Web Services

Promoted from Senior SDE to build and lead a new security organization: 4 teams, 30+ engineers; helped scale the broader org from 10 to 100+ engineers across 20+ teams.

- Hand-picked by VP-level leadership to build a new security engineering organization from the ground up: recruited and led 30+ engineers across 4 teams and owned delivery of automation products org-wide.
- Shipped a fuzzing and API-model-driven security testing framework covering all 15K+ AWS public APIs, eliminating manual test authoring across service launches.
- Injected automated security review into the AWS SDLC (Java, Python), replacing a multi-month manual process and significantly accelerating AWS service launches.
- Designed and shipped a web-based SSH client adopted by 15K+ daily users with a 4.4/5 CSAT.
- Led an account management platform handling 50K daily users at 300+ TPS.
- Drove development of the SSO/MFA authentication service for 1.5M+ Amazon employees; built an operator authorization service used across AWS safety-critical workflows.

SKILLS

Leadership: Technical strategy and roadmapping, org building, P&L ownership, M&A technical diligence, investor-facing architecture narrative

AI & Agents: Agent runtimes, MCP / Claude Code / Codex, policy boundaries, evals, multi-model routing, RAG, LLMs (Claude, GPT)

Architecture: Multi-tenant platforms, verify/deploy gates, realtime and live rooms, HIPAA / SOC 2

Stack: TypeScript, React / Node, AWS, Terraform / Docker, Cloudflare Workers

EDUCATION

M.S., Computer Science & Computer Engineering (Dual Major) | Rensselaer Polytechnic Institute

GPA: 3.8 | Dean's List | RPI Medalist
